

Problem: Employee Salary and Bonus Evaluation

Write a **program** that reads an employee's **basic salary, years of service, and performance rating (out of 10)**.

The program should perform the following operations:

1. Calculate the allowance and gross salary

- Calculate an allowance equal to **20% of the basic salary**.
- Calculate the gross salary by adding the allowance to the basic salary.
- Use **arithmetic operators**.

2. Add a fixed bonus

- Add a fixed bonus of **₹500** to the gross salary.
- Use a **shorthand assignment operator (+=)**.

3. Check bonus qualification

- An employee is considered **senior** if their years of service are **5 or more**.
- An employee is considered **eligible** if their performance rating is **7 or more**.
- If the employee is both senior **and** eligible, display:
"Employee qualifies for loyalty bonus."
- If the employee is either senior **or** eligible, display:
"Employee qualifies for partial bonus."
- Otherwise, display:
"Employee does not qualify for bonus."
- Use **relational and logical operators**.

4. Perform unary operations

- Increase the employee's years of service by **1** to represent next year's experience.
- Set a deduction amount of **₹200** and display it as a negative value using the **unary minus (-) operator**.
- Use the **increment (++) and unary minus operators**.

5. Determine the salary category

- If the final gross salary is **₹30,000 or more**, classify the employee as "High".
- Otherwise, classify the employee as "Standard".
- Use the **conditional (ternary) operator** to make this decision in one line.

6. Display additional information

- Display the gross salary.
- Display the employee's experience for next year.
- Display the bonus category.
- Display the memory size of the gross variable using the **sizeof operator**.
